First and most important is the internal condition of the sand, which must be such as to allow the passage of the fluid between its particles. Second is the amount of water in the porous stratum, a knowledge of which is necessary for determining at what point with reference to the structure the accumulation of oil may be expected. Third is the geologic structure, or the slopes of the porous stratum. If the strata have a gradual and regular slope over a considerable area, the probabilities are that there have been no accumulations of oil of economic value, but that the supply which has entered the porous stratum is evenly distributed along its upper surface. The first two factors, relating to the porosity of the rock and the degree of saturation, can be...
